

SIMATS ENGINEERING

ASSESSMENT TOOL 2

COURSE NAME: MLA03

COURSE CODE: Reinforcement learning for Environment and Agent

COURSE OUTCOME COVERED

CO2: *Apply Dynamic Programming methods to solve reinforcement learning problems and derive optimal policies for decision-making tasks. (BL2, BL3)*

Assessment Tool Weightage: 30%

Dr G.A. SENTHIL

QUESTIONS: 10

Total Marks: 50

Annexure A
Application - Based Questions

Duration: 2Hrs

1. Design and develop a Reinforcement Learning framework a ride-sharing company uses Reinforcement Learning to match drivers with passengers efficiently. Apply RL concepts to define the state space, action space, and reward function to minimize waiting time and improve service quality. **(5 Marks)**
2. An e-learning platform uses Reinforcement Learning to recommend personalized study materials. Recall how exploration and exploitation strategies help balance familiar and new content recommendations. **(5 Marks)**
3. Design and develop a Reinforcement Learning framework a robotic vacuum cleaner uses Reinforcement Learning to clean efficiently while avoiding obstacles. Apply the concept of policy and explain how the value function improves performance over time. **(5 Marks)**
4. A cryptocurrency trading system uses Reinforcement Learning to decide buy, sell, or hold actions. Outline the challenges in designing reward functions and explain how poor reward design can affect performance. **(5 Marks)**
5. Develop a smart grid system uses Reinforcement Learning to manage electricity distribution. Create an RL model by defining state space, action space, and reward mechanism. **(5 Marks)**

6. A healthcare monitoring system uses Reinforcement Learning to adjust medication dosages. Apply RL concepts to define states, actions, and rewards, and explain how learning improves outcomes. **(5 Marks)**

7. Design a model drone delivery system uses Reinforcement Learning for navigation. Recall how exploration and exploitation strategies influence route optimization. **(5 Marks)**

8. **Design and develop** a Reinforcement Learning framework a manufacturing robot uses Reinforcement Learning to optimize assembly operations. Apply the concept of policy and explain how value functions help improve efficiency. **(5 Marks)**

9. An online advertising system uses Reinforcement Learning to maximize click-through rates. Outline reward design challenges and explain their impact on system performance. **(5 Marks)**

10. A smart irrigation system uses Reinforcement Learning to optimize water usage. Create an RL framework by defining states, actions, and reward function. **(5 Marks)**

Code of Conduct:

I M.Vineela(192472071) (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

RUBRICS FOR CALCULATION

Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Understanding of Problem Context	20	Clearly understands the problem and accurately identifies all requirements	Good understanding with minor gaps	Basic understanding; some requirements unclear	Poor understanding or misinterpretation of the problem
Application of Concepts	30	Accurately applies appropriate concepts to solve complex problems	Applies relevant concepts correctly with minor errors	Applies basic concepts with limited accuracy	Fails to apply appropriate concepts
Problem-Solving Approach	20	Logical, well-structured, and efficient approach	Mostly logical approach with minor gaps	Basic approach with some inconsistencies	Illogical or unclear approach
Accuracy of Solution	20	Completely correct solution with proper justification	Mostly correct with minor errors	Partially correct solution	Incorrect or incomplete solution
Clarity	10	Clear, well-organized, and properly explained solution	Understandable with minor clarity issues	Limited clarity and explanation	Poorly presented and difficult to understand

Question 1: Design and develop a Reinforcement Learning framework a ride-sharing company uses Reinforcement Learning to match drivers with passengers efficiently. Apply RL concepts to define the state space, action space, and reward function to minimize waiting time and improve service quality.

Question Meaning:

A ride-sharing app (like Uber or Ola) wants to use RL to assign the best driver to each passenger.

The question asks you to:

- Define State Space
- Define Action Space
- Define Reward Function
- Explain how RL reduces waiting time.

Explanation

- **State:** Driver location, passenger location, traffic.
- **Action:** Choose the best driver.
- **Reward:** Less waiting time.
- **Goal:** Improve customer satisfaction.

Code

```
drivers = ["Driver A", "Driver B", "Driver C"]
waiting_time = [8, 3, 5]

best_driver = ""
min_time = 100

for i in range(len(waiting_time)):
    if waiting_time[i] < min_time:
        min_time = waiting_time[i]
        best_driver = drivers[i]

print("Best Driver:", best_driver)
print("Waiting Time:", min_time, "minutes")
```

Output:

```
===== RESTART: /Users/vinnu/Docu
Best Driver: Driver B
Waiting Time: 3 minutes
```

Question 2: An e-learning platform uses Reinforcement Learning to recommend personalized study materials. Recall how exploration and exploitation strategies help balance familiar and new content recommendations.

Question Meaning: The learning app recommends study materials.

Explain:

- Exploration
- Exploitation

Explanation

- Exploration → Try new lessons.
- Exploitation → Recommend favorite lessons.
- RL balances both.

Code

```
materials = ["Python", "AI", "ML"]
scores = [75, 95, 80]
best = ""
for i in range(len(scores)):
    if scores[i] == max(scores):
        best = materials[i]
print("Recommended Material:", best)
```

Output:

```
===== RESTART: /Users/vil
Recommended Material: AI
|
```

Question 3: Design and develop a Reinforcement Learning framework a robotic vacuum cleaner uses Reinforcement Learning to clean efficiently while avoiding obstacles. Apply the concept of policy and explain how the value function improves performance over time.

Question Meaning: A robot vacuum cleans rooms while avoiding obstacles.

Explain:

- Policy
- Value Function

Explanation

- State → Robot position.
- Action → Move.
- Policy → Best movement.
- Value Function → Learns better cleaning paths.

Code

```
moves = ["Left", "Right", "Forward", "Backward"]  
reward = [2, 5, 8, 1]  
best_move = moves[reward.index(max(reward))]  
print("Best Move:", best_move)
```

Output:

```
--> |===== RESTART: /Usi  
--> |Best Move: Forward
```

Question 4: A cryptocurrency trading system uses Reinforcement Learning to decide buy, sell, or hold actions. Outline the challenges in designing reward functions and explain how poor reward design can affect performance.

Question Meaning:

AI chooses Buy, Sell, or Hold.

Explain reward challenges.

Explanation

- Buy
- Sell
- Hold
- Reward = Profit

Code

```
actions = ["Buy", "Sell", "Hold"]
profits = [150, 80, 50]
best_action = actions[profits.index(max(profits))]
print("Best Action:", best_action)
```

Output

```
> ===== RESTART: /Use
Best Action: Buy
> |
```

Question 5: Develop a smart grid system uses Reinforcement Learning to manage electricity distribution. Create an RL model by defining state space, action space, and reward mechanism.

Question Meaning:

Manage electricity efficiently.

Explanation

- State → Electricity demand.
- Action → Increase/Decrease supply.
- Reward → Less wastage.

Code

```
demand = [80, 60, 90]
supply = max(demand)
print("Electricity Supply:", supply)
```

Output:

```
> ===== RESTART: /Us
Electricity Supply: 90
> |
```

Question 6: A healthcare monitoring system uses Reinforcement Learning to adjust medication dosages. Apply RL concepts to define states, actions, and rewards, and explain how learning improves outcomes.

Question Meaning

Adjust medicine dosage automatically.

Explanation

- State → Patient health.
- Action → Increase/Decrease dosage.
- Reward → Patient recovers.

Code

```
dosage = [5, 10, 15]
health = [60, 80, 70]
best = dosage[health.index(max(health))]
print("Best Dosage:", best, "mg")
```

Output

```
>> ===== RESTART: /U$
Best Dosage: 10 mg
>> |
```

Question 7: Design a model drone delivery system uses Reinforcement Learning for navigation. Recall how exploration and exploitation strategies influence route optimization.

Question Meaning

A delivery drone uses Reinforcement Learning to find the best route for delivering packages. The drone learns from its previous flights and improves its navigation over time.

The question asks you to explain:

- Exploration
- Exploitation
- How they help in finding the best route.

Code

```
routes = ["A", "B", "C"]
time = [15, 10, 12]
best = routes[time.index(min(time))]
print("Best Route:", best)
```

Output:

```
===== RESTART: /U
Best Route: B
>>
```

Question 8: Design and develop a Reinforcement Learning framework a manufacturing robot uses Reinforcement Learning to optimize assembly operations. Apply the concept of policy and explain how value functions help improve efficiency.

The question asks you to explain:

- Policy
- Value Function
- How they improve efficiency.

Explanation

- Policy: A rule that tells the robot which action to perform next.
- Value Function: Estimates how good each action or state is based on future rewards.
- The robot learns from previous assembly tasks and selects the best actions.
- Over time, it reduces errors, increases production speed, and improves product quality.

Code

```
tasks = ["Pick", "Assemble", "Pack"]
score = [5, 10, 7]
best = tasks[score.index(max(score))]
print("Best Task:", best)
```

Output

```
>> ===== RESTART:
Best Task: Assemble
```

Question 9: An online advertising system uses Reinforcement Learning to maximize click-through rates. Outline reward design challenges and explain their impact on system performance.

Question Meaning

An online advertising system uses Reinforcement Learning to decide which advertisement should be shown to users. The goal is to increase the number of user clicks.

Explanation

- **Reward:** A positive reward is given when a user clicks an advertisement.
- **Challenge:** Not every click means the advertisement was useful or resulted in a purchase.
- If rewards are designed poorly, the system may repeatedly show irrelevant or misleading ads.
- improve user experience, and increase click-through rates over time.

Code

```
ads = ["Ad1", "Ad2", "Ad3"]
clicks = [120, 200, 150]
best = ads[clicks.index(max(clicks))]
print("Best Advertisement:", best)
```

Output

```
> ===== RESTART: /Us
Best Advertisement: Ad2
> |
```

Question 10: A smart irrigation system uses Reinforcement Learning to optimize water usage. Create an RL framework by defining states, actions, and reward function.

Question Meaning

Water crops using minimum water.

Explanation

- **State:** Soil moisture level, weather condition, and temperature.
- **Action:** Increase watering, decrease watering, or stop watering.
- **Reward:** Positive reward when crops receive enough water with minimum water wastage.
- Over time, the RL system learns the best watering schedule, improves crop growth, and conserves water.

Code

```
soil_moisture = 30

if soil_moisture < 40:

    action = "Water the crops"

else:

    action = "Stop watering"

print("Soil Moisture:", soil_moisture)

print("Action:", action)
```

Output

```
> ===== RESTART: /U  
Soil Moisture: 30  
Action: Water the crops  
> |
```
